Student Feedback & Teaching Improvement Analyzer

Project Synopsis

A Collaborative Initiative — Equipping Faculty with Practical Skills in AI, Data Analytics, and Business Intelligence

Project Title	AI-Driven Teaching Excellence Analyzer
Domain	Educational Analytics & NLP
Tools Used	Excel + Power BI + Copilot / AI Chatbot
Faculty Name	TRIVENI MASTI
Faculty Email	4thjunetriveni@gmail.com, trivenimasti04@outlook.com
Institution	Shivraj College Arts, Commerce & D.S. Kadam Science College Gadhinglaj

3. Problem Statement

Despite the current system's ability to analyze student feedback, several **key limitations remain unaddressed**, restricting its effectiveness and innovation potential. These gaps highlight opportunities for developing a more **robust, intelligent, and award-worthy solution**:

1. Lack of Multilingual Feedback Processing

The existing system does not support feedback submitted in **regional or native languages**, leading to the exclusion of a significant portion of student responses. This results in a **representation bias** and limits the inclusivity and comprehensiveness of the analysis. There is a need for **multilingual NLP capabilities** to ensure equitable consideration of all student voices.

2. Absence of Longitudinal Performance Tracking

The current design focuses on **single-instance analysis** and lacks mechanisms to track and compare faculty performance over **multiple semesters or academic years**. Without longitudinal insights, it becomes difficult to identify **trends, progress, or decline**, thereby limiting strategic academic planning and continuous improvement.

3. Unaddressed Bias in Anonymous Feedback

Anonymous feedback systems are inherently vulnerable to **biases such as exaggerated praise, personal grievances, or irrelevant/spam responses**. The absence of bias detection and filtering mechanisms can distort sentiment analysis, leading to **misleading conclusions and unfair evaluations**. A more intelligent system must incorporate **bias detection and credibility assessment models**.

4. Lack of Personalized Faculty Improvement Roadmaps

While the system identifies strengths and weaknesses, it does not extend to generating **actionable, personalized development plans** for educators. There is a gap in translating insights into **tailored recommendations, training resources, or skill enhancement pathways**, which are essential for meaningful teaching improvement.

5. Missing Real-Time Feedback and Intervention Mechanism

The current approach processes feedback only **after course completion**, which delays corrective action. This post-facto analysis fails to leverage the opportunity for **mid-semester intervention**, where timely insights could significantly enhance ongoing teaching effectiveness and student learning experiences.

4. Objectives

- To acquire and examine student feedback data collected from surveys, course evaluations, and online platforms, with a focus on understanding its structure, attributes, and inherent data quality issues.
- To perform systematic data preprocessing, including removal of duplicate entries, treatment of missing values, correction of inconsistencies, and standardization of responses to ensure accuracy and reliability in analysis.
- To apply appropriate analytical techniques using tools such as Excel (formulas and pivot tables), Power BI, and AI-assisted prompt engineering to identify patterns, trends, and key indicators of teaching effectiveness and student satisfaction.
- To develop an interactive and user-friendly dashboard or analytical report that presents insights through clear visualizations, enabling educators and administrators to make informed, data-driven decisions.
- To integrate Artificial Intelligence tools, including platforms like Microsoft Copilot and AI chatbots, in order to automate repetitive processes, enhance analytical capabilities, and generate intelligent recommendations for teaching improvement.
- To document and present the complete project workflow, covering data collection, preprocessing, analysis, visualization, and AI integration, and to share all project artifacts through a public repository along with a demonstration video.
- To identify and analyze recurring themes in student feedback—such as teaching clarity, engagement, and assessment practices—and translate these insights into practical and actionable strategies for improving teaching quality.

5. Methodology / Implementation Plan

Provide a simple overview of how the project will be carried out. The following five-phase workflow applies to all projects under this fellowship program.

.

#	Phase	Description (Specific to Student Feedback & Teaching Improvement Analyzer)
1	**Data Collection & Exploration**	Gather raw student feedback datasets from sources such as Kaggle, Edunet, or institutional survey systems. Explore the dataset to understand field names (e.g., course, instructor, rating, comments), data types (numeric, text), and overall row count. Define the use case as improving teaching quality and the target audience as educators and administrators.
2	**Data Cleaning & Preprocessing**	Remove duplicate feedback entries, handle missing or incomplete responses, correct inconsistent data types, and standardize formats (e.g., rating scales, text entries, course codes). Use Excel functions (Remove Duplicates, IF, IFERROR, Text-to-Columns) or Power Query for preprocessing. For AI prompt-based analysis, draft and structure initial prompts using Role, Context, Task, Format, and Tone components.
3	**Analysis & AI Integration**	Apply pivot tables, Excel formulas (SUMIF, COUNTIF, VLOOKUP), or Power BI DAX measures to derive insights such as average ratings per instructor, recurring student concerns, and satisfaction levels across courses. Integrate Microsoft Copilot or AI Chatbots to generate summaries, highlight key themes in qualitative feedback, and suggest actionable teaching improvements.
4	**Visualization / Output**	Build interactive dashboards in Power BI or Excel with charts (bar, pie, trend lines), KPI cards (average satisfaction score, improvement areas), and slicers (filter by course, instructor, semester). For AI-assisted outputs, compile generated reports or summaries that translate feedback into clear recommendations for teaching enhancement. Document all AI prompts used alongside their outputs.
5	**Documentation & Submission**	Prepare a comprehensive project report detailing each phase, methodology, and findings. Upload all datasets, cleaned files, dashboards, and scripts to a GitHub repository. Record a demonstration video showcasing the workflow, dashboard, and AI integration. Submit the GitHub link, video link, and dashboard link for evaluation.

6. Resources and Timeline

A. Hardware & Software Requirements

- **Laptop or PC** — Intel Core i3 or higher, minimum 4 GB RAM (8 GB recommended)
- **Operating System** — Windows 10 / 11 or macOS
- **Microsoft Excel** — Microsoft 365 / Excel 2019 or later (for data cleaning, formulas, pivot tables)
- **Power BI Desktop** — latest version (free download from Microsoft) for dashboard creation and visualization
- **Microsoft Copilot** — available via Microsoft 365 subscription, for AI-assisted analysis and content generation
- **AI Chatbot** — ChatGPT, Google Gemini, or Microsoft Copilot Web, for prompt-based analysis and summarization of qualitative feedback
- **Internet Connection** — required for accessing Copilot, AI Chatbots, and dataset sources
- **Web Browser** — Google Chrome or Microsoft Edge (latest version)

B. Dataset

- **Availability:** The dataset may be sourced from publicly available repositories (e.g., Kaggle, UCI Repository, Edunet) or collected from institutional student feedback systems.
- **Source Link:** If using a public dataset, provide the exact link (e.g., Kaggle's *Student Feedback Survey Dataset*).
- **Alternative Collection:** If a suitable dataset is not available, feedback data can be simulated by designing sample surveys with fields such as *Course Name, Instructor, Rating (1–5), Comments, Semester*.
- **AI Prompt Projects:** For prompt-based analysis, the use case will be defined as *"Improving teaching quality through structured student feedback analysis"*. Reference content will include anonymized student comments, course evaluation forms, and institutional guidelines for teaching improvement.

C. Project Timeline

Phase	Week	Week Activities
1	*Week 1*	Dataset sourcing, exploration, and defining project scope (domain, target audience, objectives).
2	*Week 2*	Data cleaning and preprocessing (handling missing values, duplicates, formatting issues).
3	*Week 3*	Analysis using Excel formulas, pivot tables, and Power BI measures; drafting AI prompts for qualitative feedback.

4	*Week 4*	AI integration with Microsoft Copilot / Chatbots to generate summaries, insights, and recommendations.
5	*Week 5*	Dashboard creation and visualization of key findings; compiling AI-generated outputs.
6	*Week 6*	Documentation, GitHub upload, and recording of demonstration video for submission.

7. Expected Outcomes / Conclusion

The proposed project is expected to deliver the following **measurable, innovative, and scalable outcomes**, demonstrating strong real-world impact and academic value:

- **A Multilingual Feedback Analysis System**
  Capable of processing and analyzing student feedback in **multiple Indian languages**, ensuring inclusivity and eliminating linguistic bias. This outcome addresses a critical gap in existing academic feedback systems and enables comprehensive representation of diverse student voices.
- **An Anomaly-Filtered and High-Quality Dataset**
  Development of a **robust data cleaning and bias-detection framework** to filter out spam, extreme bias, and inconsistent responses. This enhances the **accuracy, reliability, and credibility** of feedback insights and establishes a methodology suitable for academic publication.
- **A Longitudinal Faculty Performance Dashboard**
  Design of an advanced dashboard that visualizes **semester-wise and year-wise performance trends** of faculty members, enabling institutions to monitor **progress, consistency, and areas of concern** over time. This serves as a valuable tool for **accreditation processes (NAAC/NBA)** and strategic planning.
- **Personalized AI-Driven Faculty Development Reports**
  Generation of **individualized improvement reports** for faculty using AI, providing **targeted recommendations, skill enhancement pathways, and resource suggestions**. This transforms static feedback into **actionable professional development guidance**.
- **A Real-Time Feedback and Alert Mechanism**
  Implementation of a system that continuously analyzes feedback during the course and triggers **early warnings for declining teaching effectiveness**, enabling **timely intervention** and immediate improvement in student learning experiences.

Collectively, these outcomes establish a **next-generation, AI-powered feedback ecosystem** that is inclusive, intelligent, and proactive—shifting the paradigm from **post-course evaluation to continuous teaching enhancement and data-driven academic excellence**.
